Introduction

Thank you for purchasing a LANCOM vRouter.

The LANCOM vRouter is a software-based router that runs on a hypervisor. Virtualization allows you to customize the vRouter exactly for your needs. As it operates the LCOS operating system, it offers the same features as a hardware-based LANCOM router and it offers considerable flexibility.

This installation guide describes how to put the LANCOM vRouter into operation. This consists of the following steps:

- Installing the vRouter on a hypervisor (VMware ESXi server or Microsoft Hyper-V) or on the cloud platforms Microsoft Azure, Amazon AWS and Google Cloud
- Initial setup of the vRouter
- Registration and activation of the vRouter

The document continues with further information about operating the LANCOM vRouter, as well as information on the LANCOM Service & Support.

The LANCOM vRouter can be operated in one of the following hypervisors:

- VMware ESXi server, see "Installation on the VMware ESXi server" on page 06
- Microsoft Hyper-V, see "Installation on Microsoft Hyper-V" on page 11
- Proxmox Virtual Environment, see "Installation in Proxmox Virtual Environment" on page 16

Hosted operation on the following cloud platforms is also possible:

- Microsoft Azure, see "Installation in Microsoft Azure" on page 23
- Amazon AWS, see "Installation in Amazon AWS" on page 27
- Google Cloud, see "Installation in Google Cloud" on page 32

vRouter files

The following files are available for the vRouter:

- **OVA file**
Basic package for deploying a vRouter in VMware ESXi or Google Cloud
- **IMG file**
Basic package for deploying a vRouter in Proxmox Virtual Environment
- **VHDX file**
Virtual disk image for deploying a vRouter in Microsoft Hyper-V
- **UPX file**
File for updating the software of existing vRouter installations created with LCOS 10.20 or higher

Dimensioning of the vRouter host

A vRouter must always have a complete CPU core available; in case of hyperthreading, also the two logical CPUs on this core.

In addition, the host should have enough free cores for packet transport and hypervisor tasks to ensure the operation of the vRouter VMs. In high-throughput scenarios, the host may need up to two additional cores per vRouter.

These requirements can be met in two ways:

1. Exclusive operation on the host
The host is dimensioned so that sufficient CPU resources are available for all vRouter instances. In this case no further settings need to be made.
2. Mixed operation of vRouter and other VMs
All other VMs must be limited in CPU affinity so that the vRouters always have enough CPU resources available.

Practical example: For an installation of 5 vRouter instances, you dimensioned the host with 2 physical cores (or 4 logical CPUs) per vRouter. This results in a total of 10 cores (or 20 logical

CPUs). The CPU affinity of the other VMs is then configured to the logical CPUs starting with number 20. Optionally, the CPU affinity of the vRouter instances can also be set to 0 to 19, e.g. to be able to distinguish between the two groups in monitoring.

In both variants, the number of vCPUs for the vRouter VM is always set to "1" so that the hypervisor does not delay the regular allocation of computing time (scheduling) to the VM

In contrast, the settings mentioned above refer to CPU affinity planning. The CPU affinity method is chosen here because the reservation of MHz is not always sufficient to ensure the availability of CPU resources for the vRouter and the hypervisor.

Installation on the VMware ESXi server

The following describes the requirements and steps for a successful installation on VMware ESXi servers.

Requirements

The following requirements must be met to successfully install the LANCOM vRouter on a VMware ESXi server:

- The LANCOM vRouter is available as an OVA file.
- VMware ESXi 6.0.0 or higher is running on a server with the Intel Xeon processor with the AES extended instruction set (AES-NI) and hardware virtualization (VT-x).
- The virtual machine must meet the following minimum requirements:
 - 1 physical x86 CPU core available on the host
 - vRouter 50 and 250: 2 GB RAM
 - vRouter 500 and 1000: 4 GB RAM
 - vRouter unlimited: 8 GB RAM
 - 512 MiB of disk space (SSD with a write rate of at least 2000 IOPS)
 - 1-5 virtual network interfaces based on VMXnet3
 - The highest possible CPU clock rate is recommended for operating the vRouter models 250, 500, 1000 and especially for the vRouter Unlimited

The Routing Performance tech paper contains information on throughput and sample performance data for the vRouter. The performance of the vRouter depends largely on the hardware of the host system used.

Installation

The following steps describe how to put the LANCOM vRouter into operation.

1. Launch VMware ESXi, log in, and create a new virtual machine.

2. Set the **creation type** to “Deploy a virtual machine from an OVF or OVA file”.

3. Enter a name for the virtual machine and select the ova file for the vRouter.

The name you enter here is the name of the router on the ESXi server and is not necessarily the name of the router in the LANCOM Management Cloud or in LANconfig.

4. Select the location where the virtual machine is stored.

5. Read and agree to the license agreements from LANCOM Systems for the vRouter.

6. Assign at least one network to the vRouter. You can add more later in the properties of the virtual machine as you require. For **Disk provisioning** choose **Thin**.

7. (Optional) Here you specify some basic settings required for deploying the vRouter:
- Device name of the vRouter for its identification in the LANCOM Management Cloud and in LANconfig.
 - The IPv4 address of the vRouter and the corresponding netmask (ETH-1 / LAN-1), separated by a space.
 - The URL to a script file (.lcs), which can contain additional configuration parameters for the vRouter (TFTP or HTTP).

8. Complete the creation of the virtual machine.

9. After the Installation Wizard is finished, the vRouter is ready for use. If the network assigned to Ethernet1 contains a DHCP server, or if an IP address was assigned during the configuration, the vRouter can be accessed and configured over this network.

After installation – commissioning

Note that after installation, the vRouter is unlicensed and the throughput for the LAN ports is limited to 1 Mbps. To remove this limitation, the first step following the installation is to activate the license (see section "Registration & activation" on page 38). After that, it is easier to take further steps such as performing a firmware update.

In particular if you wish to connect the vRouter to the LANCOM Management Cloud, be sure to perform license activation as the first step after installation. Once the license is activated, the vRouter receives a new serial number and device ID. This information is transmitted to the LMC during pairing.

Further information on operating the vRouter under ESXi

Depending on the scenario or configuration of the vRouter, the transmission of any MAC addresses, i.e. MAC addresses other than those of the Ethernet interfaces of the vRouter, must be permitted on the hypervisor. This is necessary, for example, when using protocols that use other MAC addresses such as VRRP or for WAN remote stations, depending on the configured MAC address type. This is necessary because the MAC addresses used in the packets of the vRouter do not correspond to the MAC addresses of the Ethernet interfaces and are discarded by the hypervisor without this exception.

The use of the MAC address type for WAN remote stations can be configured in the vRouter under **Configuration > Communication > Remote Sites > Remote sites (DSL)**.

In the network settings of the ESXi hypervisor, the function "Allow forged transmits" and "Allow MAC changes" of the vSwitches used in the vRouter must be activated.

Installation on Microsoft Hyper-V

The following describes the requirements and steps to successfully install a LANCOM vRouter on Hyper-V.

Requirements

Following requirements must be met to successfully install the LANCOM vRouter on Hyper-V:

- The LANCOM vRouter is available as a VHDX file.
- Microsoft Hyper-V is running on a server with the Intel Xeon processor with the AES extended instruction set (AES-NI) and hardware virtualization (VT-x).
- Microsoft Hyper-V is supported based on Microsoft Windows Server 2016, Microsoft Windows Server 2019, Microsoft Windows Server 2022, Microsoft Windows Server 2025, Microsoft Windows 10 and Microsoft Windows 11.
- The virtual machine must meet the following minimum requirements:
 - 1 physical x86 CPU core available on the host
 - vRouter 50 and 250: 2 GB RAM
 - vRouter 500 and 1000: 4 GB RAM
 - vRouter unlimited: 8 GB RAM
 - 512 MiB of disk space (SSD with a write rate of at least 2000 IOPS)
 - 1 – 5 virtual network adapters
 - The highest possible CPU clock rate is recommended for operating the vRouter models 250, 500, 1000 and especially for the vRouter Unlimited

The Routing Performance tech paper contains information on throughput and sample performance data for the vRouter. The performance of the vRouter depends largely on the hardware of the host system used.

Installation

The following steps describe how to put the LANCOM vRouter into operation.

1. Start the Hyper-V Manager.
2. Create a new “virtual machine” and follow the wizard's instructions. Important points for the LANCOM vRouter are listed below.
3. Give the virtual machine a name.

4. Select **Generation 1**.

5. The memory at startup should be at least 512 MB. Depending on your product, you should allocate more memory as specified in the requirements.

6. Connect the network to a virtual switch you configured previously.

7. Connect the virtual hard disk of the LANCOM vRouter. To do this, select the *.vhd file you received from LANCOM. If necessary, copy this to the desired location beforehand.

Note that the vRouter makes use of this virtual disk after the installation.

8. If applicable, go to the settings under **Add hardware** and add up to 5 more network adapters.

9. Start the virtual machine.

10. The LANCOM vRouter will now boot from the connected hard drive and complete the installation of the virtual machine. This phase can take some time.

After installation – commissioning

Note that after installation, the vRouter is unlicensed and the throughput for the LAN ports is limited to 1 Mbps. To remove this limitation, the first step following the installation is to activate the license (see section "Registration & activation" on page 38). After that, it is easier to take further steps such as performing a firmware update.

In particular if you wish to connect the vRouter to the LANCOM Management Cloud, be sure to perform license activation as the first step after installation. Once the license is activated, the vRouter receives a new serial number and device ID. This information is transmitted to the LMC during pairing.

Further information on operating the vRouter under Hyper-V

Depending on the scenario or configuration of the vRouter, the transmission of any MAC addresses, i.e. MAC addresses other than those of the Ethernet interfaces of the vRouter, must be permitted on the hypervisor. This is necessary, for example, when using protocols that use other MAC addresses such as VRRP or for WAN remote stations, depending on the configured MAC address type. This is necessary because the MAC addresses used in the packets of the vRouter do not correspond to the MAC addresses of the Ethernet interfaces and are discarded by the hypervisor without this exception.

The use of the MAC address type for WAN remote stations can be configured in the vRouter under **Configuration > Communication > Remote Sites > Remote sites (DSL)**. Select the MAC address to be used in the **MAC address type** field:

- If a certain MAC address must be defined for the remote gateway (**userdefined**), it can be entered into the following field.
- If **local** is selected, it will generate further virtual addresses for each WAN connection due to the device MAC address.
- If **global** is selected, the device MAC address will be used for all connections.

The **Hardware → Network Adapter → Advanced Features → Allow spoofing of MAC addresses** function must be activated in the network settings of the vRouter interface on the Hyper-V hypervisor.

Installation in Proxmox Virtual Environment

The following describes the requirements and steps to successfully install a LANCOM vRouter in **Proxmox VE**.

Requirements

Following requirements must be met to successfully install the LANCOM vRouter in **Proxmox VE**:

- You need a running Proxmox VE instance
- The vRouter install image with the file extension IMG (available in the LANCOM download portal).
- Memory recommendation (please also note for the rest of the installation process):
 - vRouter 50 and 250: 2 GB RAM
 - vRouter 500 and 1000: 4 GB RAM
 - vRouter unlimited: 8 GB RAM

The productive use of a vRouter requires a regular vRouter license.

Installation

The following steps describe how to put the LANCOM vRouter into operation.

1. First download the latest LANCOM vRouter IMG (LCOS 10.80 RU7 or newer) from the LANCOM download portal and extract the ZIP file.
2. Then click on **Create VM**.
 - Please set a valid name (e.g.: LANCOM-vRouter) and remember the **VM ID** (which will be needed in a further step):

3. Now click on the tab **OS**.

- There click on **Do not use any media** and select **Other** under Guest OS:

4. Next click on the tab **System**.

- Here please set the graphic card to **Standard VGA**:

5. On the tab **Disks** remove all shown disks:

6. Next click on the tab **CPU**.

- For local hypervisors, please select **host** as the **Type**.
- For distributed systems (e.g., VM clusters), select a **Type** that is consistent across all hosts (e.g., Intel Skylake or Ivy Bridge).

7. In the tab **Memory** please select an appropriate memory size (see also "Requirements" on page 16):

8. Next click on tab **Network**.
- For **Model** select **VirtIO (paravirtualized)**:

9. Next, please click on **Confirm** and **Finish**:

10. Now the vRouter IMG file has to be copied to the PROXMOX VE server.

Please use SCP (via console or use a Windows app e.g. WinSCP) and copy the file into the home directory: **/home**.

Example: (replace the IP address with the one of your PROXMOX server instance)

```
• Downloads $ scp LANCOM-VROUNTER-installer-10.80.0450-SU4.img root@172.16.0.186:/home/
root@172.16.0.186's password:
LANCOM-VROUNTER-installer-10.80.0450-SU4.img          100% 512MB 105.9MB/s   00:04
```

11. The next step is to import the file into the already created virtual machine.

Connect to your PROXMOX VE server via ssh and change the path to **/home**.

Example: (replace the IP address with the one of your PROXMOX server instance)

```
• ssh root@172.16.0.186
root@172.16.0.186's password:
root@pve:/# cd /home
• root@pve:/home# ls
LANCOM-VROUNTER-installer-10.80.0450-SU4.img
```

To import the IMG file to the virtual machine please use the following command (`qm importdisk VMID source target [OPTIONS]`):

The **VM ID** has to be identical to the one used in step 2.

```
• root@pve:/home# qm importdisk 100 LANCOM-VROUNTER-installer-10.80.0450-SU4.img local-lvm -format qcow2
importing disk 'LANCOM-VROUNTER-installer-10.80.0450-SU4.img' to VM 100 ...
format 'qcow2' is not supported by the target storage - using 'raw' instead
Logical volume "vm-100-disk-0" created.
transferred 0.0 B of 512.0 MiB (0.00%)
transferred 512.0 MiB of 512.0 MiB (100.00%)
Successfully imported disk as 'unused0:local-lvm:vm-100-disk-0'
```

12. To finish the installation you need to edit the settings of the created virtual machine. Please select the virtual machine (e.g. LANCOM-vRouter) und click on **Hardware**.
- Next select **CD/DVD Drive** and then on **remove**:

13. Now select **Unused Disk** and set **Bus/Device** to **VirtIO Block**:

14. Finally please change the boot order of the virtual machine. Click on **Options** and **Boot-Order**.

- Change the priority so that **virtio0** stays on top and click the checkbox to enable the virtio0 boot device. Please also deactivate the checkbox for **net0**:

The vRouter is now deployed and can be used for the further commissioning.

After installation – commissioning

Note that after installation, the vRouter is unlicensed and the throughput for the LAN ports is limited to 1 Mbps. To remove this limitation, the first step following the installation is to activate the license (see section "Registration & activation" on page 38). After that, it is easier to take further steps such as performing a firmware update.

In particular if you wish to connect the vRouter to the LANCOM Management Cloud, be sure to perform license activation as the first step after installation. Once the license is activated, the vRouter receives a new serial number and device ID. This information is transmitted to the LMC during pairing.

Installation in Microsoft Azure

The following describes the requirements and steps to successfully install a LANCOM vRouter on the cloud platform Microsoft Azure.

Requirements

Following requirements must be met to successfully install the LANCOM vRouter in Microsoft Azure:

- You need an active Microsoft Azure account with the permission to create virtual machines.
- The vRouter for Microsoft Azure is provided with the licensing model “BYOL” (Bring Your Own License). This means that the only costs billed directly through Microsoft Azure are the infrastructure costs. The productive operation of the vRouter additionally requires a regular vRouter license.

Installation

The following steps describe how to put the LANCOM vRouter into operation.

1. Go to the Azure Marketplace:
<https://azuremarketplace.microsoft.com/en-us/marketplace>
2. Search for the “LANCOM vRouter”. Select the LANCOM vRouter from the results list.
3. On the product page, select **Get it now**. Read the terms of use and the data privacy policy linked in the popup that follows and confirm with **Next**.

You will then be directed to the page for creating a virtual machine in Azure.

4. On the following page, select **Create** to generate a virtual machine for the vRouter.

5. On the following page, fill in the project details as you wish. Make sure that the **Security type** is set to “Standard” and that “LANCOM vRouter (BYOL)” is selected as the **Image**:

* Image  LANCOM vRouter (BYOL) ▼
[Browse all images and disks](#)

Please note that **Security types** other than standard are not supported!

6. Based on your performance requirements, choose one of the following recommendations for the size of the virtual machine to run the vRouter, or set your own size for the VM:

- D1_v2 Standard – 1 vCPU, 3,5 GB RAM
- DS2_v2 Standard – 2 vCPUs, 7 GB RAM
- DS3_v2 Standard – 2 vCPUs, 14 GB RAM

The B-series machines basically only offer burstable CPU performance and IOPs and are therefore only suitable for small scenarios without committed performance as well as test scenarios. Therefore, at least the Dv2 series is recommended for productive scenarios.

For small or test scenarios:

- B1ms Standard – 1 vCPU, 2 GB RAM
- B2s Standard – 2 vCPUs, 4 GB RAM
- B2ms Standard – 2 vCPUs, 8 GB RAM

Please note that, in most cases, further increasing the vCPUs does not provide any performance advantages when operating the vRouter.

7. Set the administrator account for the vRouter. You have the option of defining a main device password (authentication type **Password**) or to deposit a public SSH key that is entered in the vRouter instance.

Please note that password authentication by SSH is disabled when you deposit a public SSH key.

If an SSH key is stored, the vRouter automatically generates a random main device password during installation. This will be output to the Serial Console located in the Azure web interface under **Boot Diagnostics** or the **Serial Console**. This password allows you to login to the Serial Console for troubleshooting purposes.

8. Click **Next** to move through the pages and configure the VM according to your requirements.

- On the final page **Review and create**, check your configuration and choose **Create** to finalize the VM.

10. The vRouter is now installed in the VM. This process can take up to 20 minutes. You can follow the progress of the installation using the Serial Console or with the help of screenshots (Boot Diagnostics) from the VM.
When the installation is complete, the Azure web interface notifies you that deployment was successful. The vRouter can now be accessed from the network and, if applicable, via its public IP address. Please note that the preset network security group only permits external access via SSH and HTTPS. The network security group can then be extended according to the intended purpose of the vRouter. For example, for operation as a VPN concentrator you may need to enable ports 500 / UDP and 4500 / UDP.

After installation – commissioning

Note that after installation, the vRouter is unlicensed and the throughput for the LAN ports is limited to 1 Mbps. To remove this limitation, the first step following the installation is to activate the license (see section "Registration & activation" on page 38). After that, it is easier to take further steps such as performing a firmware update.

In particular if you wish to connect the vRouter to the LANCOM Management Cloud, be sure to perform license activation as the first step after installation. Once the license is activated, the vRouter receives a new serial number and device ID. This information is transmitted to the LMC during pairing.

Further information about operating the vRouter in Azure

By default, the vRouter in Azure is configured with just one virtual network adapter. This is preconfigured as a WAN port, which by default is used to establish a DHCPoE connection to the subnet specified when the VM is created.

For conventional router operation (e.g. for virtual private clouds), it is necessary to configure additional network cards (up to five) for the vRouter. Please noted that only the first network card can be configured as a WAN port. This is because Azure only establishes DHCPoE connections on the first network card of a VM. Further network cards for other subnets need to be configured as LAN ports accordingly.

Conversely, operation as a VPN concentrator in star topologies usually requires just one virtual network card, which is used to terminate the VPN connections.

To allow other virtual machines in Azure to use the vRouter as a gateway, a custom route must be created with the vRouter as a next-hop in the Azure routing table.

Installation in Amazon AWS

The prerequisites and individual steps for successfully commissioning a LANCOM vRouter on the Amazon AWS cloud platform are explained below.

Requirements

The following prerequisites must be met for the successful commissioning of the LANCOM vRouter in Amazon AWS:

- You need an active Amazon AWS account that has the authorization to create virtual machines.
- The vRouter for Amazon AWS is provided free of charge in the AWS Marketplace. This means that only the infrastructure costs (provisioning & usage) are charged via Amazon-AWS. For the productive operation of the vRouter, a commercially available LANCOM vRouter license is also required.

Installation

The following section describes the various steps that are necessary to commission the LANCOM vRouter for AWS.

1. Log in to AMAZON AWS in EC2 and click **Launch an Instance** there. Alternatively, click the following link:
<https://eu-central-1.console.aws.amazon.com/ec2/v2/home?region=eu-central-1#LaunchInstances:>
2. Give the instance a name (e.g. LANCOM vRouter).

3. In the **Application and OS Images** field, search for **LANCOM vRouter** and select the LANCOM vRouter in the search overview.

4. As **Instance type**, select a suitable entry that meets your requirements for processing power, RAM, etc.. The instance types **T3**, **T3a**, **C5** and **C5a** are available for selection. Our recommendation here is to select at least **t3.small** for vRouter 50 and 250.

The following sizings are recommended:

- vRouter 50 and 250: EC2 Instance with 2 GB RAM
- vRouter 500 and 1000: EC2 Instance with 4 GB RAM
- vRouter unlimited: EC2 Instance with 8 GB RAM

5. Next, you need to select a key pair for secure SSH access. You can create a new key pair as well as import an existing key. To create a new key pair, click **Create key pair** in the selection window and follow the instructions. Please make sure that **PEM** is selected as the file type.

If you already have an SSH key, you can import it in advance. Duplicate the web page and select **Network & Security > Key Pairs** in the EC2 menu and click on **Actions - Import key pair**.

This step creates a user **ec2-user** on the device. The SSH key selected here is **used to connect to the LANCOM vRouter!**

6. To allow access to the device (from the Internet), a security group must now be created. The permitted protocols / ports are configured in this group. In the preselection, only access via SSH is initially possible. To enable access to the WEBconfig of the device, we recommend additionally allowing data traffic via HTTPS during the initial installation. To do this, click on **Allow HTTPs traffic from the Internet** under **Network settings**.

Network settings [Info](#) Edit

Network [Info](#)
vpc-02b865260dc089822

Subnet [Info](#)
No preference (Default subnet in any availability zone)

Auto-assign public IP [Info](#)
Enable

Firewall (security groups) [Info](#)
A security group is a set of firewall rules that control the traffic for your instance. Add rules to allow specific traffic to reach your instance.

☒ Create security group ☐ Select existing security group

We'll create a new security group called 'launch-wizard-56' with the following rules:

- ☒ Allow SSH traffic from
Helps you connect to your instance Anywhere
0.0.0.0/0
- ☒ Allow HTTP traffic from the internet
To set up an endpoint, for example when creating a web server

7. Finally, a master device password must be assigned to the device. To do this, go to **Advanced Details** and then to **User Data** at the very bottom of the window. Now enter your desired main device password here as follows:
password=typeyourpasswordhere

Please choose a secure password considering the following minimum requirements:

- At least 8 characters
- At least 3 of the 4 character classes (lowercase letters, uppercase letters, numbers and special characters)

8. Finally, click on **Launch an Instance**.
9. Now the LANCOM vRouter is created under AWS Instances. It can take up to 5 minutes until the device has been successfully rolled out and is accessible from the Internet.
10. Now click **Show all Instances**.
11. In the EC2 menu under **Instances - Instances** you will now see the LANCOM vRouter that you have just created. By clicking on the corresponding instance ID, you can now see all the necessary connection information for the LANCOM vRouter. If you want to configure the device via WEBconfig, copy the public IPv4 address and access the device via HTTPS. If, on the other hand, you want to configure the device via SSH, click on **Connect** and then on the **SSH client** tab. There you will see a sample command for console access at the end.

Please make sure to connect to the device with the username **ec2-user** instead of **root**, otherwise access will be denied.

12. Now continue with the item „Initial setup“.

If the vRouter has the role of a NAT gateway

By default, source/destination checks are performed on EC2 instances. This means that the instance must be either the source or destination of the traffic it sends or receives. However, a NAT instance must be able to send or receive traffic that it is not the source or destination of. Therefore, you must disable source/destination checking for NAT instances.

You can disable the SrcDestCheck attribute for a NAT instance that was run or stopped from the console or command line.

To disable source/destination checking from the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, select **Instances**.
3. Select the NAT instance and then select **Actions, Network, Change Source/Destination check**.
4. Make sure that the Source / Destination check is finished. Otherwise, select **Stop**.
5. Select **Save**.
6. If the NAT instance has a secondary network interface, select it from **Network interfaces** in the **Networking** tab. Select the interface ID to go to the network interfaces page. Select **Actions** and **Change source / dest. check**, clear **Enable** and select **Save**.

Installation in Google Cloud

The following describes the requirements and steps to successfully install a LANCOM vRouter on the cloud platform **Google Cloud**.

Requirements

Following requirements must be met to successfully install the LANCOM vRouter in **Google Cloud**:

- You need an active Google Cloud account with the permission to create virtual machines and Google Cloud Buckets (data container).
- The vRouter install image can be downloaded for free via the LANCOM download portal. This means that the only costs billed directly through Google Cloud are the infrastructure costs. The productive operation of the vRouter additionally requires a regular vRouter license.

Installation

The following steps describe how to put the LANCOM vRouter into operation.

1. First download the latest LANCOM vRouter OVA file (LCOS 10.80 RU3 or newer) from the [LANCOM download portal](#).
2. Create (if not existing already) a **Cloud Bucket** within **Google Cloud Storage**.
3. Please upload the downloaded OVA file (step 1) into the created or existing **Google Cloud Bucket**:

4. Now please change to **Compute Engine** and click on **Images** and **Create Image**:
- **Name:** Set a valid name
 - **Source:** Select **Virtual disk**
 - **Virtual disk file:** Select the LANCOM vRouter OVA file (as uploaded in Google Bucket)
 - **Operating system on virtual disk:** Select **No operating system. Data only.**
 - **Install guest packages:** Deselect if possible
 - Finally click on **CREATE**

5. The import may take a few minutes. A detailed import status can be shown by clicking on the device **Cloud Build ID**:

Status	Cloud Build ID	Image name	Source	Started	Duration
✓	450d5db1-cbc3-455a-a224-3df6dcf31a2d	lancom-vrouter-2	gs://lancom-systems-gmbh/LC-vRouter-10.80.0345-RU2.ova	Just now	0 sec

6. After the import you are able to create a LANCOM vRouter instance. Please click on **Create Instance**:

7. When creating the LANCOM vRouter instance please note the following parameters:
- **Name:** Set a valid name for your instance
 - **Region & Zone:** Selects the server regions where the instance will be installed on (i.e. Europe)
 - **Machine configuration:** Select a valid machine type. Supported machines are **E2** or **N2**.
 - For the **device memory** we recommend the following settings:
 - vRouter 50 and 250: **4 GB RAM**
 - vRouter 500 and 1000: **8 GB RAM**
 - vRouter unlimited: **16 GB RAM**

- **Firewall:** Here you can select which incoming WAN traffic you want to allow.

Firewall ⓘ

Add tags and firewall rules to allow specific network traffic from the Internet

- ☐ Allow HTTP traffic
- ☒ Allow HTTPS traffic
- ☐ Allow load balancer health checks

- **Advanced options:**

→ To set a device password please click on **Management** and then **Metadata**.

→ Click on **Add item**

→ Now type in **Key 1** the value **password** and in **Value 1** your **desired device password** (as shown in the example picture below). Please choose a secure password considering the following minimum requirements:

- At least 8 characters
- At least 3 of the 4 character classes (lowercase letters, uppercase letters, numbers and special characters)

When creating an instance a standard user **gcp-user** will be created on the device. This new user as well as the default user **root** will receive the chosen password.

Metadata

You can set custom metadata for an instance or project outside of the server-defined metadata. This is useful for passing in arbitrary values to your project or instance that can be queried by your code on the instance. [Learn more](#)

Key 1 * password	Value 1 typeyourpasswordhere
----------------------------	--

[+ ADD ITEM](#)

Please note that metadata, i. e. the assigned password, is later visible in plain text via the VM instance under **Details** under **User-defined metadata**.

- **Optional:**

→ You are also able to add your own specific SSH key. Click in **Security** on **Manage Access** and **Add manually generated SSH keys** on **Add item**.

At the end of the public key you have to set the user name **gcp-user** otherwise the key won't get assigned to the correct user.

Add manually generated SSH keys

Add your own keys for VM access through a third-party tool. You cannot use these keys when IAM-based access (using OS Login) is enabled. [Learn more](#)

SSH key 1 *

ttZ9Ep5x8MYifJDcHdUG19JK5LHwRZzESjjwynGqVmtmlyM11u60X gcp-user

Enter public SSH key

[+ ADD ITEM](#)

Initial setup

A LANCOM vRouter can be configured via the local area network (LAN). Make sure that the computer you are using for the configuration is on the same LAN as the vRouter. If a DHCP server is active on the same LAN, the vRouter is automatically given an IP address where it can be reached (and found in LANconfig). If the vRouter was installed with an IP address, this can be used to access the device. After the initial setup, the vRouter can (if applicable) be integrated into the LANCOM Management Cloud.

The following options are available for the initial setup:

- LANconfig
- WEBconfig

Configuration with LANconfig

LANconfig is a part of LANtools, the free LANCOM solution package. LANconfig has a wide range of applications, from the user-friendly commissioning of a single device with various Installation Wizards, to the holistic management of several devices. It is available on the LANCOM website free of charge.

Basic settings

After starting, LANconfig automatically searches the local network for new devices and adds them to the overview.

In the overview, you invoke a context menu for the device with a simple right-click of the mouse.

This menu provides the options to **Configure** the device or to start a **Setup Wizard**.

Run the **Setup Wizard**. If the device has not yet been configured (e.g. during deployment on the ESXi or Hyper-V server), a basic setup wizard starts automatically for the configuration of basic parameters such as the main device password, IP address, etc).

The main device password is essential for resetting the vRouter.

After running the basic setup wizard, you can continue with the configuration either manually or by means of the other wizards.

Internet connection

Setting up an Internet connection is easily done with a **Setup Wizard**. Start the Setup Wizard from the context menu in LANconfig and follow the instructions.

Make sure that the Ethernet port you use for the Internet connection is not connected the LAN that is used to manage the vRouter.

Configuration with WEBconfig

WEBconfig is the web-based configuration interface of LCOS. To start the configuration in WEBconfig, simply open a web browser and type the IP address assigned during the installation into your browser's address bar.

Basic settings

If the device has not yet been configured (e.g. during deployment on the ESXi or Hyper-V server), a basic setup wizard starts automatically for the configuration of basic parameters such as the main device password, device name, IP address, etc).

The main device password is essential for resetting the vRouter.

After running the basic setup wizard, you can continue with the configuration either manually or by means of the other wizards.

Internet connection

Setting up an Internet connection is easily done with a Setup Wizard. Start the Setup Wizard using the WEBconfig menu item **Setup Wizards**.

Make sure that the Ethernet port you use for the Internet connection is not connected the LAN that is used to manage the vRouter.

Registration & activation

The functional scope of the LANCOM vRouter is determined by the license used to activate it. The license sets out framework conditions such as:

- Maximum number of VPN tunnels
- Maximum data throughput
- Maximum number of ARF networks

A vRouter without an activated license is limited to a data throughput of 1 Mbps.

Registration using LANconfig

To register the LANCOM vRouter using LANconfig, right-click on the device to open the context menu and select **Activate license**.

In the dialog that opens, enter the purchased license key and click the button **Register license**. Your web browser will then redirect you to the LANCOM Systems website to carry out the registration. After you enter the information, you can download the license file.

Activation using LANconfig

To activate the license, you can either drag & drop the downloaded license file onto the frame next to the button **Browse** or use the **Browse** button to navigate to where the license file is stored. Use the **OK** button to upload the license file to the vRouter and complete the registration.

Please note: Deleting the vRouter from the ESXi or Hyper-V server also deletes the activated license.

Further information

This chapter contains further information on the administration of the LANCOM vRouter. This includes integrating the vRouter into the LANCOM Management Cloud and resetting the vRouter.

Operation of the vRouter with WLC function as of LCOS 10.30

Depending on the license level, the vRouter supports the management of a certain number of access points with the integrated WLC function.

LANCOM Systems recommends operating a vRouter instance either primarily as a VPN gateway / router or as a WLAN controller. The recommended use can also be proportionate; for example, with the license level “vRouter 1000” (200 VPN licenses and 200 AP licenses): 100 simultaneous VPN connections and 100 managed APs or 150 simultaneous VPN connections and 50 managed APs.

Resetting the vRouter

If you want to reconfigure the vRouter irrespective of any settings you have made, you can reset the vRouter to its default settings without affecting the license. You can perform the reset in the following ways:

Reset via the command line interface (CLI)

Open the CLI for the vRouter on the ESXi server or Hyper-V server, or connect to the vRouter via an SSH connection. Once you have logged on, you perform the reset with the command **do / other/reset**. If a main password has been set for the device, this will be requested before the command is executed. After resetting, the vRouter boots.

Resetting the vRouter deletes all of the configuration settings, passwords and certificates.

Resetting via the command line interface (CLI) while retaining certificates and the main device password

In order to retain the main password and any uploaded certificates on the vRouter, you execute a command using the command line interface of the vRouter. Open the CLI for the vRouter on the ESXi server or Hyper-V server, or connect to the vRouter via an SSH connection. After logging on, enter the following command from the root of the directory tree: **default -r**.

The command **default -r** resets all of the configuration items in the current directory and its subdirectories to the default values. Certificates and the main device password in the vRouter remain unchanged.

Restrictions

The vRouter configuration should only be backed up via the LANCOM Management Cloud, LANconfig or as a script. The backup mechanisms of the respective virtual server systems (e.g. snapshot at ESXi) are not supported.

Integration into the LANCOM Management Cloud

Integrating the LANCOM vRouter into the LANCOM Management Cloud takes just a few steps.

Create an activation code

1. In the LANCOM Management Cloud, open the **Devices** view and click **New device**, then select the desired method, here **Activation code**.

2. Create an activation code by following the instructions in the dialog. This activation code allows you to integrate the LANCOM vRouter into the current project.

The **Activation code** button displays all of the activation codes created for this project in the **Devices** view

Using the activation code

1. In LANconfig, right-click to open the context menu of the vRouter and select the option **Pair device with LANCOM Management Cloud...**

2. In the dialog window that opens, enter the activation code that you generated previously and click the button **OK**.

If you copied an activation code to the Clipboard, it is automatically entered into the field.

3. Once paired with the LMC, the device will be displayed in the device overview section of the LMC. Furthermore, in LANconfig the LMC symbol appears instead of the device icon, which indicates that pairing was completed successfully.

Documentation

The full documentation for the LANCOM vRouter consists of the following parts:

- This Installation Guide offers an easy introduction for readers with knowledge of installing network components and routers and who are familiar with the workings of the basic network protocols.
- The LCOS Reference Manual fully addresses issues concerning the LANCOM operating system LCOS for this and all other models.
- The LCOS Menu Reference describes all of the parameters of LCOS in full.

The full documentation and the latest firmware and software are available from the download area of the LANCOM website.

LANCOM Service & Support

By choosing the LANCOM vRouter you have opted for maximum reliability. In the unfortunate event that you should have a problem, you are in good hands with us!

LANCOM Support

Support from reseller or distributor

You can contact your reseller or distributor for support:

www.lancom-systems.com/how-to-buy

Online

The LANCOM Knowledge Base is always available via our website:

knowledgebase.lancom-systems.com

You will also find explanations of all the functions of your LANCOM device in the documentation of the operating system used (LCOS):

www.lancom-systems.com/publications

Firmware

The latest LCOS firmwares, drivers, tools, and documentation can be downloaded free of charge from the download section on our website:

www.lancom-systems.com/downloads

Partner support

Our partners get additional support access according to their partner level. More information can be found on our website:

www.lancom-systems.com/lancommunity

LANCOM Service

Extras for your individual requirements

LANCOM Systems offers additional support as required to protect your devices in the long term. LANcare products, for example, provide increased protection during the entire product lifecycle in the form of manufacturer support with guaranteed service and response times as well as security updates. Find the right LANcare product here:

www.lancom-systems.com/products/services-support/lancare

For individual support, e.g. with network problems or configurations, you will find customized services directly from LANCOM Systems here:

www.lancom-systems.com/products/services-support/services
